

Concurrence and local asymmetry as independent coordinates: $\sqrt{p_A p_B} = C/2$, $\eta = \sqrt{p_A/p_B}$

(a) physical region; $C \rightarrow 1$ forces $\eta \rightarrow 1$

(b) Φ_U^A vs C at fixed local asymmetry

($\Delta = 2$, $p_A = C\eta/2$)

(c) asymmetry vanishes on $\eta = 1$
