

A case with many singularities: $\Delta = n - m = 8$ gives exactly 8 Uhlmann nodes

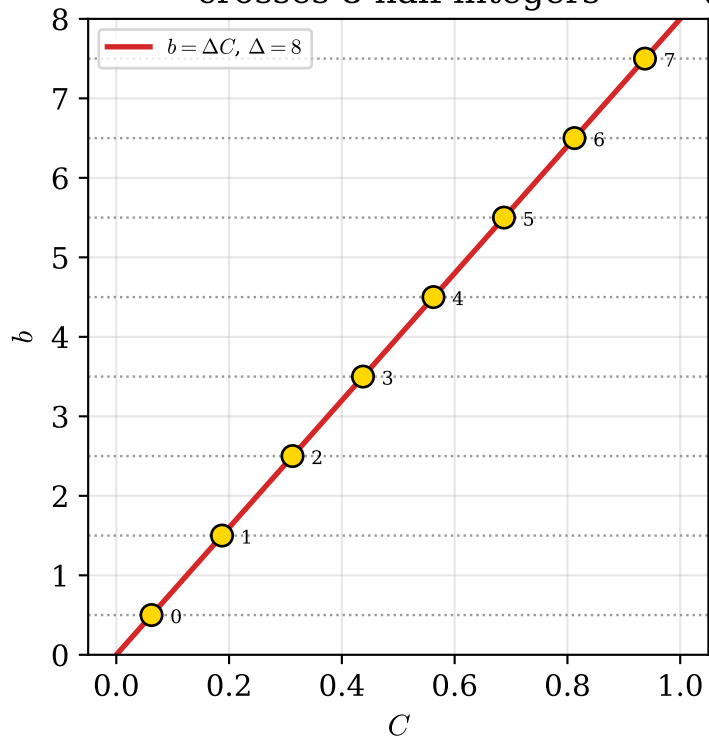

(a) $\mathbb{Z}_2$ staircase on $p = 1/2$:

Δ jumps at $C_k = (2k + 1)/2\Delta$

(b) effective winding $b = \Delta C$

crosses 8 half-integers

(c) $(m, n) = (0, 8)$, $\beta = \alpha$: 8 nodes shared by A and B
